

Name: Vladislav Ternovskiy
ID: 934716914

Design:

Start

Create an array called history to store up to 100 results
Set count = 0

Repeat forever:

 Print "Enter an arithmetic expression: "

 Read the entire line as input_string

 If input_string is valid according to rules:

 Calculate result by evaluating left to right

 Print the result

 Add result to history array

 Increase count by 1

 Else:

 Print "Not valid expression"

 Print "Would you like to enter another expression?"

 Read line as response

 If response is not yes:

 Break out of loop

Print "History:"

For each value in the history array up to count:

 Print the value on its own line

End program

Test:

Good case - "14 / 8 + 9 * 10" – Computes left to right

Bad case - "3 + 7 *" - Rejects (ends with an operator)

Edge case - "0 / 5" – Computes 0.0
